

Tracer

- professional marine tracking

Compact
Lightweight
Rugged
Durable
Weatherproof
Maintenance free

MP's Tracer is a groundbreaking invention in marine tracking technology. With Tracer, navigators can virtually pinpoint the location of buoys or gear that may not have a fixed position.

The idea originated among long line fishermen, who worked in harsh conditions in the north-eastern Atlantic. Long lining has traditionally involved lengthy search for gear that may have drifted far off – sometimes in poor visibility. However, with rising fuel costs and market uncertainties, skippers were in need of a device that would ease a costly search.

Tracer has been designed and developed together with professional fishermen in MP's laboratory as well as at sea, and the materials have been carefully selected to ensure a long and trouble free life: The IP68 tested lightweight housing is rugged and durable and contains advanced European designed technology. MP has also sought to ensure usability and compatibility with existing navigational equipment in order to reduce end user investment and effort.

All in all a handy, durable, maintenance free device designed to release time for more efficient fishing.
